
Exact model
state $(q_1, \ldots, q_N, c, \tau)$
sparse transitions,
DP solver
Exact references
optimum J^*, Pareto frontier
DP policy of each reward
Exact evaluation
forward pass of the
state distribution
v_c, latency, edge use, J
no test-set noise
model
Offloading system
N edge nodes, K classes
limits L_c, queues $q_i \leq 8$
background, cloud π_c
tune
Rules
JSQ, SLA rule,
reservation, node sets
tuned on the exact model
simulator
Deep RL training
PPO, DQN, A2C, 10 seeds
weighted, corrected,
flat reward
Policy table
greedy action of the network
in every state, queried once
gap to J^*, sign tests,
Mann-Whitney,
A_{12}, Holm
uses the exact model
learns from rewards only
